

1 **In the Claims**

2 Claims 1-75 remain in the application and are listed below:

3
4 1. (Original) An editing system comprising:
5 a switch assembly comprising one or more software-implemented matrix
6 switches, individual matrix switches comprising:
7 one or more input pins configured to receive a data stream; and
8 one or more output pins configured to output a data stream;
9 the one or more input pins being routable to the one or more output pins,
10 the switch assembly being configured to process both compressed and
11 uncompressed data streams to provide a compressed output data stream that
12 represents a user-defined editing project.

13
14 2. (Original) The editing system of claim 1, wherein the switch
15 assembly comprises multiple switches.

16
17 3. (Original) The editing system of claim 2, wherein one switch is
18 configured to process compressed data streams.

19
20 4. (Original) The editing system of claim 2, wherein one switch is
21 configured to process uncompressed data streams.

22
23 5. (Original) The editing system of claim 2, wherein one switch is
24 configured to process compressed data streams, and one switch is configured to
25 process uncompressed data streams.

1
2 6. (Original) One or more computer-readable media having computer-
3 readable instructions thereon which, when executed by a computer, provide the
4 editing system of claim 1.

5
6 7. (Original) The editing system of claim 1 configured as a multi-media
7 editing system.

8
9 8. (Original) An editing system comprising:
10 a media processing object configured to:
11 receive multiple data streams comprising compressed and
12 uncompressed data streams; and
13 process the one or more data streams to provide a compressed output
14 data stream that represents a media project.

15
16 9. (Original) The editing system of claim 8, wherein the media
17 processing object comprises a software-implemented switch assembly.

18
19 10. (Original) The editing system of claim 8, wherein the media
20 processing object comprises a software-implemented switch assembly having
21 multiple pins configured to receive or provide data streams.

22
23 11. (Original) The editing system of claim 8, wherein the media
24 processing object comprises multiple software-implemented switches each of
25 which having one or more pins configured to receive or provide data streams.

1
2 12. (Original) The editing system of claim 8, wherein the media project
3 comprises a multi-media project.
4

5 13. (Original) A multi-media editing system comprising:
6 a switch assembly comprising one or more software-implemented matrix
7 switches, individual matrix switches comprising:
8 one or more input pins configured to receive a data stream; and
9 one or more output pins configured to output a data stream;
10 the one or more input pins being routable to the one or more output pins,
11 the switch assembly being configured to process both compressed and
12 uncompressed data streams to provide a compressed output data stream that
13 represents a user-defined multi-media editing project; and
14 one or more data structures associated with the switch assembly and
15 configured for use in programming the switch assembly to provide a routing
16 scheme for routing input pins to output pins for a given multi-media editing
17 project time line.
18

19 14. (Original) The multi-media editing system of claim 13, wherein the
20 one or more data structures comprise one or more grid structures, individual grid
21 structures being configured to contain data that defines an association between
22 input and output pins for the project time line.
23

24 15. (Original) The multi-media editing system of claim 13, wherein the
25 switch assembly comprises multiple switches.

1
2 16. (Original) The multi-media editing system of claim 15, wherein the
3 one or more data structures comprise a data structure associated with at least some
4 of the multiple switches.

5
6 17. (Original) The multi-media editing system of claim 16, wherein the
7 data structures comprise grid structures that contain data that defines an
8 association between input and output pins for the project time line.

9
10 18. (Original) The multi-media editing system of claim 15, wherein one
11 switch is configured to process compressed data streams, and another switch is
12 configured to process uncompressed data streams.

13
14 19. (Original) The multi-media editing system of claim 18, wherein the
15 one or more data structures comprise data structures associated with the switches
16 that are configured to process the compressed and uncompressed data streams.

17
18 20. (Original) The multi-media editing system of claim 19, wherein the
19 data structures comprise grid structures that contain data that defines an
20 association between each switch's input and output pins for the project time line.

21
22 21. (Original) A multi-media editing system comprising:
23 a switch assembly comprising one or more non-hardware matrix switches,
24 individual matrix switches comprising:
25 one or more input pins configured to receive a data stream; and

1 one or more output pins configured to output a data stream;
2 the one or more input pins being routable to the one or more output pins,
3 the switch assembly being configured to process both compressed and
4 uncompressed data streams to provide a compressed output data stream that
5 represents a user-defined multi-media editing project.

6
7 22. (Original) The multi-media editing system of claim 21, wherein the
8 switch assembly comprises multiple switches.

9
10 23. (Original) The multi-media editing system of claim 22, wherein one
11 switch is configured to process compressed data streams.

12
13 24. (Original) The multi-media editing system of claim 22, wherein one
14 switch is configured to process uncompressed data streams.

15
16 25. (Original) The multi-media editing system of claim 22, wherein one
17 switch is configured to process compressed data streams, and another switch is
18 configured to process uncompressed data streams.

19
20 26. (Original) The multi-media editing system of claim 21 further
21 comprising one or more data structures associated with the switch assembly and
22 configured for use in programming the switch assembly to provide a routing
23 scheme for routing input pins to output pins for a given multi-media editing
24 project time line.

1 27. (Original) The multi-media editing system of claim 26, wherein the
2 one or more data structures comprise grid structures that contain data that defines
3 an association between input and output pins for the project time line.
4

5 28. (Original) An media processing system comprising:
6 switch means for receiving compressed and uncompressed data streams
7 associated with sources that are to be incorporated into a project and processing
8 the compressed and uncompressed data streams to provide a single compressed
9 output stream that represents the project; and
10 programming means associated with the switch means and configured to
11 program the switch means to provide the single compressed output stream.
12

13 29. (Original) The multi-media editing system of claim 28, wherein the
14 switch means comprises:

15 first switch means for processing the uncompressed data stream to provide
16 an output uncompressed data stream;

17 second switch means for processing the compressed data stream to provide
18 an output compressed data stream; and

19 third switch means for processing the output uncompressed and compressed
20 data streams to provide the single compressed output stream.
21

22 30. (Original) The multi-media editing system of claim 28, wherein the
23 switch means comprises means for providing a data stream as a feedback data
24 stream that is processed by the switch means.
25

1 31. (Original) The multi-media editing system of claim 28, wherein the
2 switch means comprises switch means implemented in software.

3
4 32. (Original) The multi-media editing system of claim 28, wherein the
5 switch means comprises:

6 first software switch means for processing the uncompressed data stream to
7 provide an output uncompressed data stream;

8 second software switch means for processing the compressed data stream to
9 provide an output compressed data stream; and

10 third software switch means for processing the output uncompressed and
11 compressed data streams to provide the single compressed output stream.

12
13 33. (Original) A multi-media editing system comprising:

14 a first software-implemented matrix switch comprising one or more input
15 pins and one or more output pins, the one or more input pins being routable to the
16 one or more output pins, the first matrix switch being configured to process one or
17 more uncompressed data streams and output an uncompressed data stream;

18 a second software-implemented matrix switch comprising one or more
19 input pins and one or more output pins, the one or more input pins being routable
20 to the one or more output pins, the second matrix switch being configured to
21 process one or more compressed data streams and output a compressed data
22 stream; and

23 a third software-implemented matrix switch comprising multiple input pins
24 and multiple output pins, the input pins being routable to one or more output pins,
25 the third matrix switch being configured to receive an uncompressed data stream

1 from the first switch and a compressed data stream from the second switch and
2 process the received data streams to provide a single compressed output data
3 stream that represents a user-defined multi-media editing project.

4
5 34. (Original) The multi-media editing system of claim 33 further
6 comprising a software-implemented compressor element coupled with the third
7 switch and configured to receive and compress an uncompressed data stream.

8
9 35. (Original) The multi-media editing system of claim 34 further
10 comprising a feedback path between the compressor element and an input pin of
11 the third switch configured to provide a compressed data stream to the third
12 switch's input pin.

13
14 36. (Original) The multi-media editing system of claim 33, wherein the
15 third switch is programmed to receive, when available, a data stream from the
16 second switch and, when a data stream is unavailable from the second switch, seek
17 a data stream from the first switch.

18
19 37. (Original) One or more computer-readable having computer-
20 readable instructions thereon which, when executed by a computer, provide the
21 multi-media editing system of claim 33.

22
23 38. (Original) A multi-media editing system comprising:
24 first software switch means for processing one or more uncompressed data
25 streams to provide an uncompressed data stream, the switch means comprising at

1 least one feedback loop that modifies a data stream that is output by the switch
2 means and provides the modified data stream as an input to the switch means;

3 second software switch means for processing one or more compressed data
4 streams to provide a compressed data stream; and

5 a third software switch means for receiving an uncompressed data stream
6 from the first software switch means and a compressed data stream from the
7 second software switch and processing the received data streams to provide a
8 single compressed output data stream that represents a user-defined multi-media
9 editing project.

10
11 39. (Original) The multi-media editing system of claim 38 further
12 comprising programming means associated with the first and second software
13 switch means for programming routing of data streams therethrough.

14
15 40. (Original) A multi-media editing system comprising:

16 a first software-implemented matrix switch comprising one or more input
17 pins and one or more output pins, the one or more input pins being routable to the
18 one or more output pins, the first matrix switch being configured to process one or
19 more uncompressed data streams and output an uncompressed data stream;

20 a second software-implemented matrix switch comprising one or more
21 input pins and one or more output pins, the one or more input pins being routable
22 to the one or more output pins, the second matrix switch being configured to
23 process one or more compressed data streams and output a compressed data
24 stream;

1 a third software-implemented matrix switch comprising multiple input pins
2 and multiple output pins, the input pins being routable to one or more output pins,
3 the third matrix switch being configured to receive an uncompressed data stream
4 from the first switch and a compressed data stream from the second switch and
5 process the received data streams to provide a single compressed output data
6 stream that represents a user-defined multi-media editing project; and

7 one or more data structures associated with at least some of the matrix
8 switches and configured for use in programming the associated switches to
9 provide a routing scheme for routing input pins to output pins.

10
11 41. (Original) The multi-media editing system of claim 40, wherein the
12 one or more data structures comprise one or more grid structures that contain data
13 that defines an association between input and output pins for a project time line.

14
15 42. (Original) The multi-media editing system of claim 40, wherein the
16 one or more data structures comprise multiple data structures, individual data
17 structures being associated with the first and second switches.

18
19 43. (Original) The multi-media editing system of claim 42, wherein the
20 data structures comprise grid structures each of which contains data that defines an
21 association between input and output pins of its associated switch for a project
22 time line.

23
24 44. (Original) A multi-media editing method comprising:
25

1 providing a switch assembly comprising one or more software-
2 implemented matrix switches, individual matrix switches comprising one or more
3 input pins and one or more output pins, the one or more input pins being routable
4 to the one or more output pins, the switch assembly being configured to process
5 both compressed and uncompressed data streams to provide a compressed output
6 data stream that represents a user-defined multi-media editing project; and

7 programming the switch assembly using one or more data structures, said
8 programming providing a routing scheme for routing input pins to output pins for
9 a given time period.

10
11 45. (Original) The multi-media editing method of claim 44, wherein said
12 providing comprises providing multiple switches at least one of which being
13 configured to process both compressed and uncompressed data streams.

14
15 46. (Original) The multi-media editing method of claim 44, wherein said
16 providing comprises providing multiple switches, one of which being configured
17 to process only compressed data streams.

18
19 47. (Original) The multi-media editing method of claim 44, wherein said
20 providing comprises providing multiple switches, one of which being configured
21 to process only uncompressed data streams.

22
23 48. (Original) The multi-media editing method of claim 44, wherein said
24 providing comprises providing multiple switches:
25

1 at least one of which being configured to process both compressed and
2 uncompressed data streams;

3 at least one of which being configured to process only compressed data
4 streams; and

5 at least one of which being configured to process only uncompressed data
6 streams.

7
8 49. (Original) The multi-media editing method of claim 44, wherein said
9 programming comprises programming the switch assembly using one or more grid
10 structures, individual grid structures containing data defining an association
11 between input pins, output pins, and a project time line.

12
13 50. (Original) The multi-media editing method of claim 44 further
14 comprising:

15 representing the editing project as a hierarchical tree structure; and
16 processing the hierarchical tree structure to provide at least one grid
17 structure containing data that defines an association between input pins, output
18 pins and a time line defined by the editing project.

19
20 51. (Original) The multi-media editing method of claim 44, wherein said
21 programming comprises:

22 defining a first grid structure containing data that defines an association
23 between input pins, at least one output pin and a time line defined by the editing
24 project; and
25

1 defining a second grid structure containing data that defines an association
2 between different input pins, at least one different output pin and the time line
3 defined by the editing project.
4

5 52. (Original) The multi-media editing method of claim 51, wherein the
6 first grid structure is associated with programming the switch assembly to process
7 the uncompressed data stream.
8

9 53. (Original) The multi-media editing method of claim 51, wherein the
10 second grid structure is associated with programming the switch assembly to
11 process the compressed data stream.
12

13 54. (Original) The multi-media editing method of claim 51, wherein said
14 defining of the second grid structure comprises deriving the second grid structure
15 from the first grid structure.
16

17 55. (Original) One or more computer-readable media having computer-
18 readable instructions thereon which, when executed by a computer, implement the
19 method of claim 44.
20

21 56. (Original) A multi-media editing application executable on one or
22 more computers to implement the method of claim 44.
23
24
25

1 57. (Original) One or more computer-readable media having computer-
2 readable instructions thereon which, when executed by a computer, cause the
3 computer to:

4 provide a switch assembly comprising multiple software-implemented
5 matrix switches, individual matrix switches comprising one or more input pins and
6 one or more output pins, the one or more input pins being routable to the one or
7 more output pins, the switch assembly comprising:

8 a first switch configured to process uncompressed data streams to provide
9 an uncompressed output data stream;

10 a second switch configured to process compressed data streams to provide a
11 compressed output data stream; and

12 a third switch configured to receive both the uncompressed and compressed
13 output data streams and process the data streams to provide a compressed output
14 data stream that represents a user-defined multi-media editing project; and

15 program the switch assembly by defining a first grid structure containing
16 data that defines an association between the first switch's input pins, at least one
17 output pin and a time line defined by the editing project, and defining a second
18 grid structure containing data that defines an association between the second
19 switch's input pins, at least one output pin and the time line defined by the editing
20 project.

21
22 58. (Original) The computer-readable media of claim 57, wherein the
23 instructions cause the computer to derive the second grid structure from the first
24 grid structure.
25

1 59. (Original) The computer-readable media of claim 58, wherein the
2 instructions cause the computer to derive the second grid structure by:

3 determining whether any entries in the second grid structure are associated
4 with a data stream source that is not in a format that is the same as or compatible
5 with a format associated with the compressed output data stream that represents a
6 user-defined multi-media editing project; and

7 removing any entry that is not in the same or compatible format.

8
9 60. (Original) The computer-readable media of claim 59, wherein said
10 format is associated with a frame rate.

11
12 61. (Original) The computer-readable media of claim 59, wherein said
13 format is associated with a data rate.

14
15 62. (Original) The computer-readable media of claim 58, wherein the
16 instructions cause the computer to derive the second grid structure by:

17 copying the first grid structure;

18 evaluating the copied grid structure to ascertain entries associated with data
19 source streams that are modified in some way; and

20 removing any grid entries associated with data source streams that are
21 modified in some way.

22
23 63. (Original) A multi-media editing method comprising:

24 providing a first software-implemented matrix switch comprising one or
25 more input pins and one or more output pins, the one or more input pins being

1 routable to the one or more output pins, the first matrix switch being configured to
2 process one or more uncompressed data streams and output an uncompressed data
3 stream;

4 providing a second software-implemented matrix switch comprising one or
5 more input pins and one or more output pins, the one or more input pins being
6 routable to the one or more output pins, the second matrix switch being configured
7 to process one or more compressed data streams and output a compressed data
8 stream;

9 providing a third software-implemented matrix switch comprising multiple
10 input pins and multiple output pins, the input pins being routable to one or more
11 output pins;

12 receiving, with the third matrix switch, an uncompressed data stream from
13 the first switch and a compressed data stream from the second switch; and

14 processing the received data streams with the third switch to provide a
15 single compressed output data stream that represents a user-defined multi-media
16 editing project.

17
18 64. (Original) The multi-media editing method of claim 63, wherein said
19 processing comprises:

20 compressing the uncompressed data stream received from the first switch
21 using a software-implemented compressor element coupled with the third switch;
22 and

23 routing the compressed data stream that was compressed by the compressor
24 element to an input pin of the third switch.

25

1 65. (Original) The multi-media editing method of claim 63 further
2 comprising receiving with the third switch, when available, a data stream from the
3 second switch and, when a data stream is unavailable from the second switch,
4 seeking with the third switch, a data stream from the first switch.

5
6 66. (Original) One or more computer-readable media having computer-
7 readable instructions thereon which, when executed by a computer, implement the
8 method of claim 63.

9
10 67. (Original) One or more computer-readable media having computer-
11 readable instructions thereon which, when executed by a computer, cause the
12 computer to:

13 process at least one compressed data stream to provide an output
14 compressed data stream that comprises a portion of a user-defined multi-media
15 editing project that is associated with a data stream source;

16 process one or more uncompressed data streams to manipulate the one or
17 more uncompressed data streams to provide an output uncompressed data stream
18 that comprises a different portion of a user-defined multi-media editing project
19 that is associated with one or more data stream sources;

20 compress the output uncompressed data stream; and

21 associate the output compressed data stream and the compressed output
22 uncompressed data stream together to provide a compressed stream that represents
23 a user-defined multi-media editing project.

1 68. (Original) The computer-readable media of claim 67, wherein the
2 instructions cause the computer to provide a software-implemented matrix switch
3 that associates the data streams to provide the user-defined multi-media editing
4 project.

5
6 69. (Original) The computer-readable media of claim 67, wherein the
7 instructions cause the computer to provide a software-implemented matrix switch
8 that associates the data streams to provide the user-defined multi-media editing
9 project, the software-implemented matrix switch being configured to receive the
10 output compressed data stream when it is available, and seek the output
11 uncompressed data stream when the output compressed data stream is unavailable.

12
13 70. (Original) One or more computer-readable media having computer-
14 readable instructions thereon which, when executed by a computer, cause the
15 computer to:

16 receive and process one or more uncompressed data streams with a first
17 software-implemented matrix switch comprising one or more input pins and one
18 or more output pins, the one or more input pins being routable to the one or more
19 output pins to output an uncompressed data stream;

20 receive and process one or more compressed data streams with a second
21 software-implemented matrix switch comprising one or more input pins and one
22 or more output pins, the one or more input pins being routable to the one or more
23 output pins to output a compressed data stream;

24 receive and process the uncompressed data stream that is output by the first
25 switch and the compressed data stream that is output by the second switch with a

1 third software-implemented matrix switch comprising multiple input pins
2 individual ones of which receive data streams, and one or more output pins
3 individual ones of which provide data streams, the one or more input pins being
4 routable to the one or more output pins to output, at one output pin, a compressed
5 data stream that represents a user-defined multi-media editing project.

6
7 71. (Original) The computer-readable media of claim 70, wherein the
8 instructions cause the computer to:

9 compress the uncompressed data stream output by the first switch using the
10 third switch; and

11 incorporate the compressed uncompressed data stream with the compressed
12 data stream that is output by the second switch to provide the compressed data
13 stream that represents the user-defined editing project.

14
15 72. (Original) The computer-readable media of claim 70, wherein the
16 instructions cause the computer to program the first and second switches using
17 first and second data structures respectively associated with the first and second
18 switches, each data structure providing a routing scheme for routing switch input
19 pins to switch output pins.

20
21 73. (Original) The computer-readable media of claim 72, wherein the
22 first and second data structures comprise grid structures that provide an
23 association between input pins, output pins and a time line defined by a user-
24 defined multi-media editing project.

1 74. (Original) The computer-readable media of claim 73, wherein the
2 instructions cause the computer to derive the second grid structure from the first
3 grid structure.

4
5 75. (Original) The computer-readable media of claim 74, wherein the
6 instructions cause the computer to derive the second grid structure by:

7 copying the first grid structure;

8 evaluating the copied grid structure to ascertain entries associated with data
9 source streams that are modified in some way; and

10 removing any grid entries associated with data source streams that are
11 modified in some way.
